Duration	23 mins 59 secs

Question 1

Correct

Marked out of 5.00

You are provided with a set of numbers (array of numbers).

You have to generate the sum of specific numbers based on its position in the array set provided to you.

This is explained below:

Example 1:

Let us assume the encoded set of numbers given to you is:

input1:5 and input2: {1, 51, 436, 7860, 41236}

Step 1:

Starting from the 0th index of the array pick up digits as per below:

0th index – pick up the units value of the number (in this case is 1).

1st index - pick up the tens value of the number (in this case it is 5).

2nd index - pick up the hundreds value of the number (in this case it is 4).

3rd index - pick up the thousands value of the number (in this case it is 7).

4th index - pick up the ten thousands value of the number (in this case it is 4).

(Continue this for all the elements of the input array).

The array generated from Step 1 will then be – {1, 5, 4, 7, 4}.

Step 2:

Square each number present in the array generated in Step 1.

{1, 25, 16, 49, 16}

Step 3:

Calculate the sum of all elements of the array generated in Step 2 to get the final result. The result will be = 107.

Note:

- 1) While picking up a number in Step1, if you observe that the number is smaller than the required position then use 0.
- 2) In the given function, input1[] is the array of numbers and input2 represents the number of elements in input1.

Example 2:

input1: 5 and input1: {1, 5, 423, 310, 61540}

Step 1:

Generating the new array based on position, we get the below array:

{1, 0, 4, 0, 6}

In this case, the value in input1 at index 1 and 3 is less than the value required to be picked up based on position, so we use a 0.

Step 2:

{1, 0, 16, 0, 36}

Step 3:

The final result = 53.

For example:

Input	Result
5 1 51 436 7860 41236	107
5 1 5 423 310 61540	53

Answer: (penalty regime: 0 %)

```
1 import java.util.Scanner;  
2  
3 public class SumOfDigitPositions {  
4     public static void main(String[] args) {  
5         Scanner scanner = new Scanner(System.in);
```

```

6
7 // Prompt the user for input
8 int inputCount = scanner.nextInt();
9
10 int[] inputNumbers = new int[inputCount];
11
12 // Read input numbers
13 for (int i = 0; i < inputCount; i++) {
14     inputNumbers[i] = scanner.nextInt();
15 }
16
17 int[] digitPositions = new int[inputCount];
18
19 // Calculate the digit at the specific positions
20 for (int i = 0; i < inputCount; i++) {
21     int number = inputNumbers[i];
22     // Get the digit at position (i + 1)
23     int digit = (number / (int) Math.pow(10, i)) % 10;
24     digitPositions[i] = (i < String.valueOf(number).length()) ? digit : 0; // Check for
25 }
26
27 // Calculate the sum of the squares of the digits
28 int sum = 0;
29 for (int value : digitPositions) {
30     sum += value * value;
31 }
32
33 System.out.println( + sum);
34 scanner.close();
35 }
36 }

```

	Input	Expected	Got	
✓	5 1 51 436 7860 41236	107	107	✓
✓	5 1 5 423 310 61540	53	53	✓

Passed all tests! ✓

Question 2

Correct

Marked out of 5.00

Given an array of numbers, you are expected to return the sum of the longest sequence of POSITIVE numbers in the array.

If there are NO positive numbers in the array, you are expected to return -1.

In this question's scope, the number 0 should be considered as positive.

Note: If there are more than one group of elements in the array having the longest sequence of POSITIVE numbers, you are expected to return the total sum of all those POSITIVE numbers (see example 3 below).

input1 represents the number of elements in the array.

input2 represents the array of integers.

Example 1:

input1 = 16

input2 = {-12, -16, 12, 18, 18, 14, -4, -12, -13, 32, 34, -5, 66, 78, 78, -79}

Expected output = 62

Explanation:

The input array contains four sequences of POSITIVE numbers, i.e. "12, 18, 18, 14", "12", "32, 34", and "66, 78, 78". The first sequence "12, 18, 18, 14" is the longest of the four as it contains 4 elements. Therefore, the expected output = sum of the longest sequence of POSITIVE numbers = 12 + 18 + 18 + 14 = 63.

Example 2:

input1 = 11

input2 = {-22, -24, 16, -1, -17, -19, -37, -25, -19, -93, -61}

Expected output = -1

Explanation:

There are NO positive numbers in the input array. Therefore, the expected output for such cases = -1.

Example 3:

input1 = 16

input2 = {-58, 32, 26, 92, -10, -4, 12, 0, 12, -2, 4, 32, -9, -7, 78, -79}

Expected output = 174

Explanation:

The input array contains four sequences of POSITIVE numbers, i.e. "32, 26, 92", "12, 0, 12", "4, 32", and "78". The first and second sequences "32, 26, 92" and "12, 0, 12" are the longest of the four as they contain 4 elements each. Therefore, the expected output = sum of the longest sequence of POSITIVE numbers = (32 + 26 + 92) + (12 + 0 + 12) = 174.

For example:

Input	Result
16 -12 -16 12 18 18 14 -4 -12 -13 32 34 -5 66 78 78 -79	62
11 -22 -24 -16 -1 -17 -19 -37 -25 -19 -93 -61	-1
16 -58 32 26 92 -10 -4 12 0 12 -2 4 32 -9 -7 78 -79	174

Answer: (penalty regime: 0 %)

```

1 import java.util.Scanner;
2
3 public class LongestPositiveSequenceSum {
4
5     public static void main(String[] args) {
6         Scanner scanner = new Scanner(System.in);
7
8
9         int input1 = scanner.nextInt();

```

```

10
11     int[] input2 = new int[input1];
12
13     for (int i = 0; i < input1; i++) {
14         input2[i] = scanner.nextInt();
15     }
16
17     int maxLength = 0;    // Length of the longest positive sequence
18     int currentLength = 0; // Current length of the ongoing positive sequence
19     int currentSum = 0;    // Sum of the current positive sequence
20     int maxSum = 0;        // Sum of the longest positive sequence
21
22     for (int num : input2) {
23         if (num >= 0) {
24             currentLength++;
25             currentSum += num;
26         } else {
27             if (currentLength > maxLength) {
28                 maxLength = currentLength;
29                 maxSum = currentSum;
30             } else if (currentLength == maxLength) {
31                 maxSum += currentSum;
32             }
33             // Reset for the next sequence
34             currentLength = 0;
35             currentSum = 0;
36         }
37     }
38
39     // Final check at the end of the loop
40     if (currentLength > maxLength) {
41         maxLength = currentLength;
42         maxSum = currentSum;
43     } else if (currentLength == maxLength) {
44         maxSum += currentSum;
45     }
46
47     // If no positive numbers were found
48     if (maxLength == 0) {
49         System.out.println(-1);
50     } else {
51         System.out.println( + maxSum);
52     }

```

	Input	Expected	Got	
✓	16 -12 -16 12 18 18 14 -4 -12 -13 32 34 -5 66 78 78 -79	62	62	✓
✓	11 -22 -24 -16 -1 -17 -19 -37 -25 -19 -93 -61	-1	-1	✓
✓	16 -58 32 26 92 -10 -4 12 0 12 -2 4 32 -9 -7 78 -79	174	174	✓

Passed all tests! ✓

Question 3

Correct

Marked out of 5.00

Given an integer array as input, perform the following operations on the array, in the below specified sequence.

1. Find the maximum number in the array.
2. Subtract the maximum number from each element of the array.
3. Multiply the maximum number (found in step 1) to each element of the resultant array.

After the operations are done, return the resultant array.

Example 1:

input1 = 4 (represents the number of elements in the input1 array)

input2 = {1, 5, 6, 9}

Expected Output = {-72, -36, 27, 0}

Explanation:

Step 1: The maximum number in the given array is 9.

Step 2: Subtracting the maximum number 9 from each element of the array:

$\{(1 - 9), (5 - 9), (6 - 9), (9 - 9)\} = \{-8, -4, -3, 0\}$

Step 3: Multiplying the maximum number 9 to each of the resultant array:

$\{(-8 \times 9), (-4 \times 9), (3 \times 9), (0 \times 9)\} = \{-72, -36, -27, 0\}$

So, the expected output is the resultant array {-72, -36, -27, 0}.

Example 2:

input1 = 5 (represents the number of elements in the input1 array)

input2 = {10, 87, 63, 42, 2}

Expected Output = {-6699, 0, -2088, -3915, -7395}

Explanation:

Step 1: The maximum number in the given array is 87.

Step 2: Subtracting the maximum number 87 from each element of the array:

$\{(10 - 87), (87 - 87), (63 - 87), (42 - 87), (2 - 87)\} = \{-77, 0, -24, -45, -85\}$

Step 3: Multiplying the maximum number 87 to each of the resultant array:

$\{(-77 \times 87), (0 \times 87), (-24 \times 87), (-45 \times 87), (-85 \times 87)\} = \{-6699, 0, -2088, -3915, -7395\}$

So, the expected output is the resultant array {-6699, 0, -2088, -3915, -7395}.

Example 3:

input1 = 2 (represents the number of elements in the input1 array)

input2 = {-9, 9}

Expected Output = {-162, 0}

Explanation:

Step 1: The maximum number in the given array is 9.

Step 2: Subtracting the maximum number 9 from each element of the array:

$\{(-9 - 9), (9 - 9)\} = \{-18, 0\}$

Step 3: Multiplying the maximum number 9 to each of the resultant array:

$\{(-18 \times 9), (0 \times 9)\} = \{-162, 0\}$

So, the expected output is the resultant array {-162, 0}.

Note: The input array will contain not more than 100 elements

For example:

Input	Result
4 1 5 6 9	-72 -36 -27 0

Input	Result
5 10 87 63 42 2	-6699 0 -2088 -3915 -7395
2 -9 9	-162 0

Answer: (penalty regime: 0 %)

```

1 import java.util.Scanner;
2
3 public class ArrayTransform {
4
5     public static int[] transformArray(int[] arr) {
6         int max = Integer.MIN_VALUE;
7
8         // Find the maximum value in the array
9         for (int num : arr) {
10             if (num > max) {
11                 max = num;
12             }
13         }
14
15         // Transform the array based on the maximum value
16         for (int i = 0; i < arr.length; i++) {
17             arr[i] = (arr[i] - max) * max; // Applying the transformation
18         }
19
20         return arr;
21     }
22
23     public static void main(String[] args) {
24         Scanner scanner = new Scanner(System.in);
25
26         // Read the size of the array
27         int n = scanner.nextInt();
28         int[] arr = new int[n];
29
30         // Read the array elements
31         for (int i = 0; i < n; i++) {
32             arr[i] = scanner.nextInt();
33         }
34
35         // Transform the array
36         int[] transformedArray = transformArray(arr);
37
38         // Print the transformed array
39         for (int value : transformedArray) {
40             System.out.print(value + " ");
41         }
42
43         scanner.close();
44     }
45 }

```
